

AI Usage Note

Project: AskDB – AI-Powered Natural Language to SQL Query Builder

AI Tools Used

- ChatGPT
- Antigravity

Purpose of AI Usage

AI tools were used to assist with project planning, system architecture, UI/UX design, feature refinement, documentation, and development guidance. All generated suggestions were reviewed, modified where necessary, and manually integrated into the project.

Prompts Used

Three major prompts were used during development:

1. Designing and building AskDB as a Flask-based AI-powered Natural Language to SQL Query Builder with SQLite support, schema analysis, SQL generation, safe query execution, results visualization, and a Neo-Brutalist SaaS interface.
2. Converting AskDB from a single-page application into a multi-page SaaS platform with Landing, Login, Signup, Database Upload, Query Workspace, History, and Profile pages, including authentication, navigation, and query history management.
3. Refining the application into a production-quality SaaS experience by improving workspace layouts, database management, analytics widgets, theme support, help center functionality, upload workflows, responsiveness, and overall user experience.

What AI Helped With

- Application architecture and folder structure planning
- UI/UX design recommendations
- Feature specification and workflow design
- Flask development guidance
- Responsive layout suggestions
- Documentation drafting
- Debugging assistance and implementation support

What AI Got Wrong

Some AI-generated suggestions required manual corrections, including:

- Responsive layout adjustments
- Excessive whitespace in UI components
- Optimization of Flask implementation patterns
- Alignment and styling improvements
- Workflow refinements to better match project requirements

Human Contributions

The following work was completed manually:

- Requirement analysis and project planning
- Code implementation and integration
- Debugging and testing
- UI customization and refinements
- Validation of generated outputs
- Documentation review
- Final quality assurance and project preparation

Transparency Statement

AI tools were used as development assistants to improve productivity and accelerate the development process. All AI-generated outputs were reviewed, validated, and refined before inclusion in the final project. The final submission represents a combination of AI-assisted development and human implementation, testing, decision-making, and verification.
